## 54/74160 • 54LS/74LS160 54/74162 • 54LS/74LS162 SYNCHRONOUS PRESETTABLE BCD DECADE COUNTERS

DESCRIPTION - The ' 160 and '162 are high speed synchronous decade counters operating in the BCD (8421) sequence. They are synchronously presettable for application in programmable dividers and have two types of Count Enable inputs plus a Terminal Count output for versatility in forming synchronous multistage counters. The ' 160 has an asynchronous Master Reset input that overrides all other inputs and forces the outputs LOW. The '162 has a Synchronous Reset input that overrides counting and parallel loading and allows all outputs to be simultaneously reset on the rising edge of the clock. For the S-TTL and LP-TTL versions, please see the 9310 data sheet.

- SYNCHRONOUS COUNTING AND LOADING
- HIGH SPEED SYNCHRONOUS EXPANSION
- TYPICAL COUNT RATE OF 35 MHz
- LS VERSIONS FULLY EDGE TRIGGERED

ORDERING CODE: See Section 9

| TC | Terminal Count Output | 20/10 | $\begin{array}{r} 10 / 5.0 \\ (2.5) \end{array}$ |

## LOGIC DIAGRAMS 'LS160

'LS162

FUNCTIONAL DESCRIPTION - The ' 160 and ' 162 count modulo-10 in the $B C D(8421)$ sequence. From state 9 (HLLH) they increment to state 0 (LLLL). The ' 161 and ' 163 count modulo-16 binary sequence. From state 15 ( HHHH ) they increment to state 0 (LLLU. The clock inputs of all flip-flops are driven in parallel through a clock buffer. Thus all changes of the Q outputs (except due to Master Reset of the ' 160 and '161) occur as a result of, and synchronous with, the LOW-to-HIGH transition of the CP input signal. The circuits have four fundamental modes of operation, in order of precedence: asynchronous reset ('160 and '161), synchronous reset ('162 and '163), parallel load, count-up and hold. Five control inputs - Master Reset ( $\overline{M R}$, ' 160 and '161), Synchronous Reset ( $\overline{S R}$, ' 162 and '163), Parallel Enable ( $\overline{P E}$ ), Count Enable Parallel (CEP) and Count Enable Trickle (CET) determine the mode of operation, as shown in the Mode Select Table. A LOW signal on $\overline{M R}$ overrides all other inputs and asynchronously forces all outputs LOW. A LOW signal on $\overline{S R}$ overrides counting and parallel loading and allows all outputs to go LOW on the next rising edge of CP. A LOW signal on $\overline{P E}$ overrides counting and allows information on the Parallel Data $\left(P_{n}\right)$ inputs to be loaded into the flip-flops on the next rising edge of CP. With $\overline{P E}$ and $\overline{M R}$ ('160, '161) or $\overline{S R}(' 162, ~ ' 163) ~ H I G H, ~ C E P ~ a n d ~ C E T ~ p e r m i t ~ c o u n t i n g ~ w h e n ~ b o t h ~ a r e ~ H I G H . ~$ Conversely, a LOW signal on either CEP or CET inhibits counting.

The TTL versions (' 160 - '163, as opposed to the 'LS160 - 'LS163) contain master/slave flip-flops which are "next-state catching" because of the JK feedback. This means that when CP is LOW, information that would change the state of a flip-flop, whether from the counting logic or the parallel entry logic if either mode is momentarily enabled, enters the master and is locked in. Thus to avoid inadvertently changing the state of a master latch, and the subsequent transfer of the erroneous information to the slave when the clock rises, it is necessary to insure that neither the counting mode, the synchronous reset mode, nor the parallel entry mode is momentarily enabled while CP is LOW.

The LS-TTL versions ('LS160 - 'LS163) use D-type edge-triggered flip-flops and changing the $\overline{S R}, \overline{P E}, C E P$ and CET inputs when the CP is in either state does not cause errors, provided that the recommended setup and hold times, with respect to the rising edge of CP, are observed.

The Terminal Count (TC) output is HIGH when CET is HIGH and the counter is in its maximum count state (9 for the decade counters, 15 for the binary counters). To implement synchronous multistage counters, the TC outputs can be used with the CEP and CET inputs in two different ways. These two schemes are shown in the 9310 data sheet. The TC output is subject to decoding spikes due to internal race conditions and is therefore not recommended for use as a clock or asynchronous reset for flip-flops, counters or registers. In the LS-TTL versions ('LS160, 'LS162) of the decade counters, the TC output is fully decoded and can only beHIGH in state 9. In the TTL versions ('160, '162), however, the TC output can also be HIGH in the illegal states 11, 13 and 15. If a decade counter is preset to an illegal state, or assumes an illegal state when power is applied, it will return to the normal sequence within two counts, as shown in the state diagrams.

LOGIC EQUATIONS: Count Enable = CEP $\cdot$ CET $\cdot$ PE
('160, '162) TC = $Q_{0} \bullet Q_{3} \bullet C E T$
('LS160, 'LS162) TC $=\mathrm{Q}_{0} \cdot \overline{\mathrm{Q}}_{1} \cdot \overline{\mathrm{Q}}_{2} \cdot \mathrm{Q}_{3} \cdot C E T$
('161, 'LS161, '163, 'LS163) $T C=Q_{0} \bullet Q_{1} \bullet Q_{2} \bullet Q_{3} \bullet C E T$

MODE SELECT TABLE

| * $\overline{S R}$ | $\overline{\text { PE }}$ | CET | CEP | Action on the Rising Clock Edge ( $\boldsymbol{\Omega}$ ) |
| :---: | :---: | :---: | :---: | :---: |
| L | X | X | X | RESET (Clear) |
| H | L | X | X | LOAD ( $\mathrm{P}_{\mathrm{n}} \rightarrow \mathrm{Q}_{n}$ ) |
| H | H | H | H | COUNT (Increment) |
| H | H | L | X | NO CHANGE (Hold) |
| H | H | X | L | NO CHANGE (Hold) |

-For the '162 and '163 only.
H = HIGH Voltage Level
L = LOW Voltage Level
