### DIGITAL 8000 SERIES TTL/MSI

#### DESCRIPTION

The 8243 8-Bit Position Scaler is an MSI array of approximately 70 gate complexity. The primary function of the 8243 is to scale (or shift) data bit positions by a selection of a 3-bit binary selector code.

The most significant bit input ( $I_7$ ) may be shifted 8 positions to the least significant bit output ( $O_0$ ). At zero shift, or scale select, all eight input data bits are transferred and inverted to their respective outputs, ( $I_0$  to  $O_0$ ,  $I_1$  to  $O_1$ ,  $I_2$  to  $O_2$ , etc.) At a shift, or scale select, of one, each input bit ( $I_n$ ) will shift to the next lower output bit ( $O_{n-1}$ ). See truth table for other shift codes.

The 8243's advantages over shift registers are the speed of operation and lower complexity of external logic required to effect a scale function. The speed of the 8243 Scaler is a function of gate propagation delays—the speed of equivalent shift registers is the time for clock periods plus the propagation delay to effect a scale function.

The 8243 is provided with open collector outputs to provide expansion to larger scaling functions. Data input logic zero loading is reduced to less than  $-100\mu A$  when the unit is disabled.

**NOTES:**

1. All voltage measurements are referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
2. All measurements are taken with ground pin tied to zero volts.
3. Positive current is defined as into the terminal referenced.
4. Positive NAND logic definition:  
"UP" Level = "1", "DOWN" Level = "0".
5. Precautionary measures should be taken to ensure current limiting in accordance with Absolute Maximum Ratings should the isolation diodes become forward biased.
6. Output sink current is supplied through a resistor to  $V_{CC}$ .
7. Connect an external 1k resistor from  $V_{CC}$  to the output terminal for this test.
8. Manufacturer reserves the right to make design and process changes and improvements.
9. Refer to AC Test figures.
10.  $I_n$  "0" threshold 0.7 volts for S8243.
11. Input under test at 0.4V, other Enable Input tied to  $V_{CC}$ .
12. Input under test at 4.5V, other Enable Input, 0 volts.
13.  $V_{CC} = 5.25V$ .
