

The 8821,8822 and 8824 Dual Master-Slave J-K Binaries provide pin configuration and logic input variations of the same basic device to obtain maximum board layout convenience and design flexibility.

The 8821 , available in the J package only, provides common clock and $\bar{R}_{D}$ inputs and separate $\bar{S}_{D}$ inputs. This configuration is especially useful in synchronous counter and shift register applications. Where a dual in-line package is required, the 8824 is recommended.

The 8822 provides separate clock and separate $\bar{R}_{D}$ inputs and is in the dual in-line (A) package and has $\mathrm{V}_{\mathrm{cc}}$ at pin 14 and ground at pin 7 for consistency with other dual in-line pin configurations. This pin configuration can significantly simplify board layout. The 8822 is also available in the J package.

The 8824 is available in the 16 pin dual in-line (B) package. This unit provides two separate binaries with full synchronous and asynchronous access. The 8824 provides Vcc and ground pin orientation which is consistent with other dual in-line devices and thus simplifies board layout.

Triggering is accomplished on the negative transition (falling edge) of the clock pulse. Set up time must be greater than or equal to the clock pulse width. There is no hold time requirement for the inputs. Set up time is defined as the time prior to a negative transition of the clock line.

For optimum reliability, all three devices are fabricated from a single monolithic die.

NOTES:

1. All voltage and capacitance measurements are, referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
2. All measurements are taken with ground pin tied to zero volts.
3. Positive current flow is defined as into the terminal referenced.
4. Positive NAND Logic definition: "UP" Level = " 1 ", "DOWN" Level = " 0 ".
5. Precautionary measures should be taken to ensure current limiting in accondance with Absolute Maximum Ratings should the isolation diodes become forward biased.
6. Measurements apply to each element independently
7. Capacitance as measured on Boonton Electronic Corporation Model 75A-S8 Capacitance Bridge or equivalent. $f=1 \mathrm{MHz}, \mathrm{Vac}_{\mathrm{ac}}=25 \mathrm{mV}$ rms. All pins not specifically referenced are tied to guard for capacitance tests. Output pins are left open.
8. Output source current is supplied through a resistor to ground
9. Output sink current is supplied through a resistor to $\mathrm{V}_{\mathrm{cc}}$.
10. One DC fan-out is defined as 0.8 mA
11. One AC fan-out is defined as 50 pf .
12. This test guarantees operation free of input latch-up over the specified operating power supply voltage range.
Manufacturer reserves the right to make design and process changes and improvements.
13. Detailed test conditions for AC testing are in Section 3
14. Test conditions and limits for the Set input are not applicable to the 8822.
15. For 8822 , momentarily apply zero volts to $Q$ and $V_{c c}$ to $Q$ to ensure state of the binary element prior to test measurement.
16. For clock tests, ground $J$ and $K$. For J,K and $S_{D}$ tests, ground clock. For $R_{D}$ tests, ground J on 8821 and clock on 8822 and 8824.
