## NOTES:

1. All voltage measurments are referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
2. All measurements are taken with ground pin tied to zero volts.
3. Positive current is defined as into the terminal referenced.
4. Positive logic definition: "UP" Leval $={ }^{\prime \prime} 1 "$."DOWN" Level $=" 0 "$.
5. Precautionary measures should be taken to ensure current limiting in accordance with Absolute Maximum Ratings should the isolation diodes become forward biased.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. Output source current is applied through a resistor to ground.
8. Output sink current is supplied through a resistor to $V_{\text {cc }}$.
9. $V_{C C}=0.00 \mathrm{~V}$
10. Not more than one output should be shorted at a time.
11. Hysteresis is defined as the voltage difference between the $R$ input level at which the output begins to go from " $O$ " to " 1 " state and the level at which the output begins to go from " 1 " to " 0 ".
12. See Hysteresis test circuit.
13. Refer to $A C$ test circuits.
14. $V_{C C}=5.25 \mathrm{~V}$.

the following occurs per Figure 2 . the following occurs per Figure 2.

1. $V_{1} \times$ and $V_{2}$ must be between 0.7 V minimum and 1.7 maximum.
2. Hysteresis $=V_{1} \cdot V_{2}$
