LC²MOS 4/8 Channel High Performance Analog Multiplexers

## ADG408/ADG409

## FEATURES

44 V Supply Maximum Ratings
$\mathbf{V}_{\text {ss }}$ to $\mathrm{V}_{\mathrm{DD}}$ Analog Signal Range
Low On Resistance ( $100 \Omega$ max)
Low Power ( Isupply $<75 \mu \mathrm{~A}$ )
Fast Switching
Break-Before-Make Switching Action
Plug-in Replacement for DG408/ DG409

## APPLICATIONS

Audio and Video Routing
Automatic Test Equipment
Data Acquisition Systems
Battery Powered Systems
Sample and Hold Systems
Communication Systems

## GENERAL DESCRIPTION

T he AD G 408 and AD G 409 are monolithic C M OS analog multiplexers comprising 8 single channels and four differential channels respectively. The AD G 408 switches one of eight inputs to a common output as determined by the 3-bit binary address lines A0, A1 and A2. The ADG 409 switches one of four differential inputs to a common differential output as determined by the 2-bit binary address lines A0 and A1. An EN input on both devices is used to enable or disable the device. When disabled, all channels are switched OFF.
The AD G 408/AD G 409 are designed on an enhanced $L C^{2}$ M OS process which provides low power dissipation yet gives high switching speed and low on resistance. Each channel conducts equally well in both directions when ON and has an input signal range which extends to the supplies. In the OFF condition, signal levels up to the supplies are blocked. All channels exhibit break before make switching action preventing momentary shorting when switching channels. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

The AD G 408/AD G 409 are improved replacements for the D G 408/D G 409 Analog M ultiplexers.

[^0]FUNCTIONAL BLOCK DIAGRAMS

## PRODUCT HIGHLIGHTS

1. Extended Signal Range

The AD G 408/AD G 409 are fabricated on an enhanced $L^{2}{ }^{2} \mathrm{M}$ OS process giving an increased signal range that extends to the supply rails.
2. Low Power Dissipation

3 Low Ron
4. Single Supply Operation

For applications where the analog signal is unipolar, the AD G 408/AD G 409 can be operated from a single rail power supply. T he parts are fully specified with a single +12 V power supply and will remain functional with single supplies as low as +5 V .

NOTES
${ }^{1}$ Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.
${ }^{2} O$ vervoltages at A, EN , S or D will be clamped by internal diodes. Current should be limited to the maximum ratings given.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although these devices features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## TERMINOLOGY

| $V_{\text {DD }}$ | M ost positive power supply potential. |
| :---: | :---: |
| $\mathrm{V}_{\text {SS }}$ | M ost negative power supply potential in dual supplies. In single supply applications, it may be connected to ground. |
| GND | Ground ( 0 V ) reference. |
| $\mathrm{R}_{\text {ON }}$ | Ohmic resistance between D and S . |
| $\Delta \mathrm{R}_{\text {ON }}$ | Difference between the $R_{\text {on }}$ of any two channels. |
| $\mathrm{I}_{S}(\mathrm{OFF})$ | Source leakage current when the switch is off. |
| $I_{\text {D }}$ (OFF) | D rain leakage current when the switch is off. |
| $I_{D}, I_{S}(O N)$ | Channel leakage current when the switch is on. |
| $\mathrm{V}_{\mathrm{D}}\left(\mathrm{V}_{\mathrm{S}}\right)$ | Analog voltage on terminals D, S. |
| $\mathrm{C}_{S}$ (OFF) | Channel input capacitance for "OFF" condition. |
| $C_{\text {d }}$ (OFF) | C hannel output capacitance for "OFF" condition. |
| $C_{D}, C_{S}(O N)$ | "ON" switch capacitance. |
| $\mathrm{C}_{\text {IN }}$ | Digital input capacitance. |
| $t_{\text {ON }}(E N)$ | Delay time between the $50 \%$ and $90 \%$ points of the digital input and switch "ON" condition. |
| $\mathrm{t}_{\text {OFF }}$ (EN) | Delay time between the $50 \%$ and $90 \%$ points of the digital input and switch "OFF" condition. |
| $t_{\text {transition }}$ | Delay time between the $50 \%$ and $90 \%$ points of the digital inputs and the switch "ON" condition when switching from one address state to another. |
| $t_{\text {OPEN }}$ | "OFF" time measured between the $80 \%$ point of both switches when switching from one address state to another. |
| $\mathrm{V}_{\text {INL }}$ | $M$ aximum input voltage for logic " 0 ." |
| $\mathrm{V}_{\text {INH }}$ | M inimum input voltage for logic " 1.0 |
| $\mathrm{I}_{\text {INI }}\left(\mathrm{I}_{\text {INH }}\right)$ | Input current of the digital input. |
| Crosstalk | A measure of unwanted signal which is coupled through from one channel to another as a result of parasitic capacitance. |
| Off Isolation | A measure of unwanted signal coupling through an "OFF" channel. |
| Charge Injection | A measure of the glitch impulse transferred from the digital input to the analog output during switching. |
| $I_{\text {DD }}$ | Positive supply current. |
| $\mathrm{I}_{\text {S }}$ | N egative supply current. |
