## AH0014/AH0014C* DPDT, AH0015/AH0015C Quad SPST, AH0019/AH0019C* Dual DPST-TTL/DTL Compatible MOS Analog Switches

## General Description

This series of TTL/DTL compatible MOS analog switches feature high speed with internal level shifting and driving. The package contains two monolithic integrated circuit chips: the MOS analog chip is similar to the MM450 type which consists of four MOS analog switch transistors; the second chip is a bipolar I.C. gate and level shifter. The series is available in hermetic dual-in-line package.
These switches are particularly suited for use in both military and industrial applications such as commutators in data acquisition systems, multiplexers, A/D and D/A converters, long time constant integrators, sample and hold circuits, modulators/demodulators, and other analog signal switching applications.

The AH0014, AH0015 and AH0019 are specified for operation over the $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ military temperature range. The AH0014C, AH0015C and AH0019C are specified for operation over the $-25^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range.

## Features

| - Large analog voltage switching | $\pm 10 \mathrm{~V}$ |
| :--- | ---: |
| Fast switching speed | 500 ns |
| - Operation over wide range of power supplies |  |
| Low ON resistance | $200 \Omega$ |
| High OFF resistance | $10^{11} \Omega$ |
| - Analog signals in excess of | 25 MHz |
| - Fully compatible with DTL or TTL logic |  |
| - Includes gating and level shifting |  |

## Block and Connection Diagrams

## Selecting Power Supply Voltage

The graph shows the boundary conditions which must be used for proper operation of the unit. The range of operation for power supply $\mathrm{V}^{-}$is shown on the X axis. It must be between -25 V and -8 V . The allowable range for power supply $\mathrm{V}^{+}$is governed by supply $\mathrm{V}^{-}$. With a value chosen for $\mathrm{V}^{-}, \mathrm{V}^{+}$may be selected as any value along a vertical line passing through the $\mathrm{V}^{-}$value and terminated by the boundaries of the operating region. A voltage difference between power supplies of at least 5V should be maintained for adequate signal swing.

National Semiconductor

## AH5009/AH5010/AH5011/AH5012 Monolithic

## Analog Current Switches

## General Description

A versatile family of monolithic JFET analog switches economically fulfills a wide variety of multiplexing and analog switching applications.
Even numbered switches may be driven directly from standard 5 V logic, whereas the odd numbered switches are intended for applications utilizing 10 V or 15 V logic. The monolithic construction guarantees tight resistance match and track.

For voltage switching applications see LF13331, LF13332, and LF13333 Analog Switch Family, or the CMOS Analog Switch Family.

## Applications

- A/D and D/A converters

■ Micropower converters
© Industrial controllers

- Position controllers
- Data acquisition
- Active filters
- Signal multiplexers/demultiplexers
- Multiple channel AGC
- Quad compressors/expanders
- Choppers/demodulators
- Programmable gain amplifiers
- High impedance voltage buffer
- Sample and hold

## Features

- Interfaces with standard TTL and CMOS
- "ON" resistance match $2 \Omega$
- Low "ON" resistance $100 \Omega$
- Very low leakage 50 pA
- Large analog signal range $\pm 10 \mathrm{~V}$ peak
- High switching speed 150 ns
- Excellent isolation between 80 dB
channels at 1 kHz

the device beyond its specified operating conditions.
Note 2: Test conditions $25^{\circ} \mathrm{C}$ unless otherwise noted.
Note 3: "OFF" and "ON" notation refers to the conduction state of the FET switch.
Note 4: Thermal Resistance:

## Test Circuits and Switching Time Waveforms

Normalized Drain Resistance vs Blas Voltage

## Applications Information

Theory of Operation
The AH series of analog switches are primarily intended for operation in current mode switch applications; i.e., the drains of the FET switch are held at or near ground by operating into the summing junction of an operational amplifier. Limiting the drain voltage to under a few hundred millivolts eliminates the need for a special gate driver, allowing the switches to be driven directly by standard TTL (AH5010), 5 V -10V CMOS (AH5010), open collector 15V TTL/CMOS (AH5009).
Two basic switch configurations are available: 4 independent switches (SPST) and 4 pole switches used for multiplexing (4 PST-MUX). The MUX versions such as the AH5009 offer common drains and include a series FET operated at $\mathrm{V}_{\mathrm{GS}}=0 \mathrm{~V}$. The additional FET is placed in the feedback path in order to compensate for the "ON" resistance of the switch FET as shown in Figure 1.
The closed-loop gain of Figure 1 is:

$$
A_{\mathrm{VCL}}=\frac{\mathrm{R} 2+\mathrm{rDS}_{\mathrm{O}}(\mathrm{ON}) \mathrm{Q} 2}{\mathrm{R} 1+\mathrm{rOS}_{\mathrm{O}}(\mathrm{ON}) \mathrm{Q} 1}
$$

For $\mathrm{R1}=\mathrm{R} 2$, gain accuracy is determined by the rDS(ON) match between Q1 and Q2. Typical match between Q1 and Q2 is 4 ohms resulting in a gain accuracy of $0.05 \%$ (for R1 $=R 2=10 \mathrm{k} \Omega$ ).

## Noise Immunity

The switches with the source diodes grounded exhibit improved noise immunity for positive analog signals in the
"OFF" state. With $\mathrm{V}_{\mathrm{IN}}=15 \mathrm{~V}$ and the $\mathrm{V}_{\mathrm{A}}=10 \mathrm{~V}$, the source of $Q 1$ is clamped to about 0.7 V by the diode $\left(\mathrm{V}_{\mathrm{GS}}=14.3 \mathrm{~V}\right.$ ) ensuring that ac signals imposed on the 10 V input will not gate the FET "ON."

## Selection of Gain Setting Resistors

Since the AH series of analog switches are operated in current mode, it is generally advisable to make the signal current as large as possible. However, current through the FET switch tends to forward bias the source to gate junction and the signal shunting diode resulting in leakage through these junctions. As shown in Figure 2, $\mathrm{I}_{\mathrm{G}(\mathrm{ON})}$ represents a finite error in the current reaching the summing junction of the op amp.
Secondly, the rDS(ON) of the FET begins to "round" as Is approaches IDSS. A practical rule of thumb is to maintain Is at less than $1 / 10$ of loss.
Combining the criteria from the above discussion yields:

$$
\begin{equation*}
R 1_{\min } \geq \frac{V_{A(M A X)} A_{D}}{I_{G(O N)}} \tag{2a}
\end{equation*}
$$

or:

$$
\begin{equation*}
\geq \frac{\mathrm{V}_{\mathrm{A}(\mathrm{MAX})}}{\mathrm{IDSS}^{2} / 10} \tag{2b}
\end{equation*}
$$

whichever is larger.

FIGURE 1. Use of Compensation FET

FIGURE 2. On Leakage Current, $\mathrm{I}_{\mathrm{G}(\mathrm{ON})}$

## Applications Information (Continued)

Where: $V_{A(M A X)}=$ Peak amplitude of the analog input signal
AD = Desired accuracy
IG(ON) = Leakage at a given Is
loss = Saturation current of the FET switch
$\cong 20 \mathrm{~mA}$
In a typical application, $V_{A}$ might $= \pm 10 \mathrm{~V}, A_{D}=0.1 \%$, $0^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq 85^{\circ} \mathrm{C}$. The criterion of equation (2b) predicts:

$$
R 1_{(\mathrm{MIN})} \geq \frac{(10 \mathrm{~V})}{\left(\frac{20 \mathrm{~mA}}{10}\right)}=5 \mathrm{k} \Omega
$$

For $R 1=5 k$, $I_{s} \cong 10 \mathrm{~V} / 5 \mathrm{k}$ or 2 mA . The electrical characteristics guarantee an $\mathrm{I}_{\mathrm{G}(\mathrm{ON})} \leq 1 \mu \mathrm{~A}$ at $85^{\circ} \mathrm{C}$ for the AH5010. Per the criterion of equation (2a):

$$
R_{(\text {MIN })} \geq \frac{(10 \mathrm{~V})\left(10^{-3}\right)}{1 \times 10^{-6}} \geq 10 \mathrm{k} \Omega
$$

Since equation (2a) predicts a higher value, the 10k resistor should be used.
The "OFF" condition of the FET also affects gain accuracy. As shown in Figure 3, the leakage across Q2, ID(OFF) represents a finite error in the current arriving at the summing junction of the op amp.

Accordingly:

$$
R 1_{(M A X)} \leq \frac{V_{A(M I N)} A_{D}}{(N) I_{D(O F F)}}
$$

Where: $\mathrm{V}_{\mathrm{A}(\mathrm{MIN})}=$ Minimum value of the analog input signal

$$
\begin{array}{ll}
A_{D} & =\text { Desired accuracy } \\
\mathrm{N} & =\text { Number of channels } \\
\mathrm{I}_{\mathrm{D}(\mathrm{OFF})} & =\text { "OFF" leakage of a given FET } \\
\text { switch }
\end{array}
$$

As an example, if $\mathrm{N}=10, A_{D}=0.1 \%$, and $\mathrm{I}_{\mathrm{D}(\mathrm{OFF})} \leq 10 \mathrm{nA}$ at $85^{\circ} \mathrm{C}$ for the AH5009. R1 (MAX) is:

$$
R 1_{(\operatorname{MAX})} \leq \frac{(1 \mathrm{~V})\left(10^{-3}\right)}{(10)\left(10 \times 10^{-9}\right)}=10 k
$$

Selection of R2, of course, depends on the gain desired and for unity gain R1=R2.
Lastly, the foregoing discussion has ignored resistor tolerances, input bias current and offset voltage of the op ampall of which should be considered in setting the overall gain accuracy of the circuit.

## TTL Compatibility

The AH series can be driven with two different logic voltage swings: the even numbered part types are specified to be driven from standard 5V TTL logic and the odd numbered types from 15 V open collector TTL.

TL/H/5659-5
FIGURE 3

## Applications Information (Continued)

Standard TTL gates pull-up to about 3.5V (no load). In order to ensure turn-off of the even numbered switches such as AH5010, a pull-up resistor, $R_{\text {EXT }}$, of at least $10 \mathrm{k} \Omega$ should be placed between the $5 \mathrm{~V} \mathrm{~V}_{\mathrm{CC}}$ and the gate output as shown in Figure 4.
Likewise, the open-collector, high voltage TTL outputs should use a pull-up resistor as shown in Figure 5. In
both cases, $t_{\text {(OFF }}$ is improved for lower values of $R_{\text {EXT }}$ at the expense of power dissipation in the low state.

## Definition of Terms

The terms referred to in the electrical characteristics tables are as defined in Figure 6.
