

KA2224B

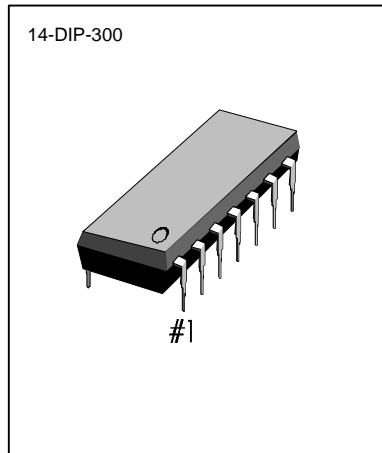

DUAL EQ AMP WITH ALC

GENERAL DESCRIPTION

The KA2224B is a monolithic integrated circuit consisting of a dual equalizer amplifier with ALC, and it is suitable for stereo radio cassettes.

FEATURES

- Dual equalizer amplifier with a built-in ALC circuit.
- Recording amp available because of high gain characteristic (Variable monitor possible).
- Good channel separation (CS = 50dB Typ).
- Quick stabilization after power on.
- Capable of direct meter driving and ALC transistor.
- Good ALC response balance between channels.
- Wide operating supply voltage range: $V = 4V \sim 13V$

A. Playback amplifier

$$G_v = 20 \log \frac{Z}{R_F} \text{ (dB) at } f = 1\text{KHz, } G_v = 42\text{dB (Typ) } Z = R_1 // (R_2 + \frac{1}{2\pi f \cdot C_2})$$

B. Recording amplifier

$$G_v = 20 \log \frac{R_1}{R_F} \text{ (dB) at } f = 1\text{KHz, } G_v = 58\text{dB (Typ)}$$

2. ALC Circuit

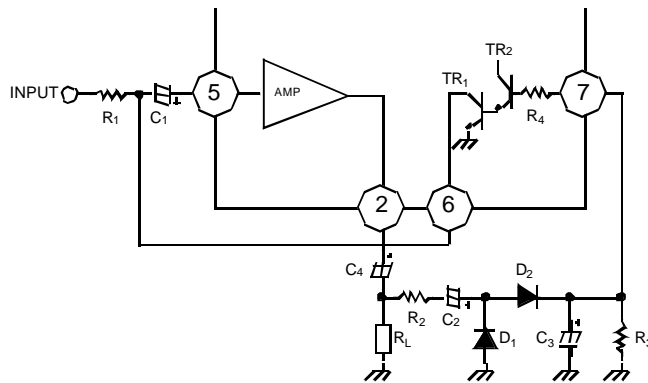

Fig. 4

The ALC circuit consists

of TR_1 , TR_2 and some external component. The output level of the amplifier is rectified by external circuits. Since this DC level is applied to the ALC input terminal (Pin 7), the impedance between the collector and emitter of TR_1 can change its value, therefore the pre-amplifier input level can be controlled.
