

## LM3354 Regulated 90mA Buck-Boost Switched Capacitor DC/DC Converter

Check for Samples: [LM3354](#)

### FEATURES

- Regulated  $V_{OUT}$  with  $\pm 3\%$  (5.0V, 4.1V, and 3.3V Options) or  $\pm 4\%$  (1.8V Option) Accuracy
- Standard Output Voltages of 1.8V, 3.3V, 4.1V, and 5.0V
- Custom Output Voltages Available from 1.8V to 5.0V in 100 mV Increments with Volume Order
- 2.5V to 5.5V Input Voltage Range
- Up to 90mA (5.0V, 4.1V, and 1.8V Options) or 70mA (3.3V Option) Output Current
- $>75\%$  Average Efficiency
- Uses Few, Low-cost External Components
- Very Small Solution Size
- 375  $\mu$ A Typical Operating Current
- 2.3  $\mu$ A Typical Shutdown Current
- 1 MHz Typical Switching Frequency
- Architecture and Control Methods Provide High Load Current and Good Efficiency
- VSSOP-10 Package
- Over-temperature Protection

### APPLICATIONS

- White LED Display Backlights
- 1-cell Lilon Battery-operated Equipment Including PDAs, Hand-held PCs, Cellular Phones
- Flat Panel Displays
- Hand-held Instruments
- Li-Ion, NiCd, NiMH, or Alkaline Battery Powered Systems

### Typical Operating Circuit

### DESCRIPTION

The LM3354 is a CMOS switched capacitor DC/DC converter that produces a regulated output voltage by automatically stepping up (boost) or stepping down (buck) the input voltage. It accepts an input voltage between 2.5V and 5.5V. The LM3354 is available with standard output voltages of 1.8V, 3.3V, 4.1V (ideal for white LED applications), and 5.0V. If other output voltage options between 1.8V and 5.0V are desired, please contact your TI representative.

The LM3354's proprietary buck-boost architecture enables up to 90mA of load current at an average efficiency greater than 75%. Typical operating current is only 375  $\mu$ A and the typical shutdown current is only 2.3  $\mu$ A.

The LM3354 is available in a 10-pin VSSOP package. This package has a maximum height of only 1.1 mm.

The high efficiency of the LM3354, low operating and shutdown currents, small package size, and the small size of the overall solution make this device ideal for battery powered, portable, and hand-held applications.

See the LM3352 for up to 200mA of output current or the LM3355 for up to 50mA of output current.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## Connection Diagram

**Figure 1. Top View  
VSSOP-10 Pin Package  
See Package Number DGS0010A**

### PIN DESCRIPTIONS

Pin Number	Name	Function
1	$V_{IN}$	Input Supply Voltage
2	C1-	Negative Terminal for C1
3	C1+	Positive Terminal for C1
4	GND	Ground
5	GND	Ground
6	$C_{FIL}$	Filter Capacitor, a 1 $\mu$ F capacitor is recommended.
7	$\overline{SD}$	Shutdown, active low
8	$V_{OUT}$	Regulated Output Voltage
9	C2-	Negative Terminal for C2
10	C2+	Positive Terminal for C2

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)(2)</sup>

All Pins		–0.5V to 5.6V
Power Dissipation ( $T_A = 25^\circ\text{C}$ ) <sup>(3)</sup>		Internally Limited
$T_{JMAX}$ <sup>(3)</sup>		150°C
$\theta_{JA}$ <sup>(3)</sup>		250°C/W
Storage Temperature		–65°C to +150°C
Lead Temperature (Soldering, 5 sec.)		260°C
ESD Rating <sup>(4)</sup>	Human Body Model	1.5 kV
	Machine Model	100V

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur. Operating Ratings are conditions for which the device is intended to be functional, but device parameter specifications may not be ensured. For ensured specifications and test conditions, see "Electrical Characteristics".
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) As long as  $T_A \leq +85^\circ\text{C}$ , all electrical characteristics hold true and the junction temperature should remain below +120°C except for the 5V output option. The 5V option requires that  $T_A \leq +60^\circ\text{C}$ .
- (4) The human body model is a 100 pF capacitor discharged through a 1.5 k $\Omega$  resistor into each pin. The machine model is a 200 pF capacitor discharged directly into each pin.

## OPERATING RATINGS

Input Voltage ( $V_{IN}$ )	2.5V to 5.5V
Output Voltage ( $V_{OUT}$ )	1.8V to 5.0V
Ambient Temperature ( $T_A$ ) <sup>(1)</sup>	–40°C to +85°C
Junction Temperature ( $T_J$ ) <sup>(1)</sup>	–40°C to +120°C

- (1) As long as  $T_A \leq +85^\circ\text{C}$ , all electrical characteristics hold true and the junction temperature should remain below +120°C except for the 5V output option. The 5V option requires that  $T_A \leq +60^\circ\text{C}$ .

## ELECTRICAL CHARACTERISTICS

Limits in standard typeface are for  $T_A = 25^\circ\text{C}$ , and limits in **boldface** type apply over the full operating temperature range. Unless otherwise specified:  $C_1 = C_2 = 0.33\ \mu\text{F}$ ;  $C_{IN} = 10\ \mu\text{F}$ ;  $C_{OUT} = 10\ \mu\text{F}$ ;  $C_{FIL} = 1\ \mu\text{F}$ ;  $V_{IN} = 3.5\text{V}$ .

Parameter	Conditions	Min (1)	Typ (2)	Max (1)	Units
<b>LM3354-5.0</b>					
Output Voltage ( $V_{OUT}$ )	$3.4\text{V} < V_{IN} < 5.5\text{V}$ ; $1\text{ mA} < I_{LOAD} < 90\text{ mA}$	4.85/ <b>4.8</b>	5.0	5.15/ <b>5.2</b>	V
	$3.1\text{V} < V_{IN} < 5.5\text{V}$ ; $1\text{ mA} < I_{LOAD} < 55\text{ mA}$	4.85/ <b>4.8</b>	5.0	5.15/ <b>5.2</b>	
	$2.9\text{V} < V_{IN} < 5.5\text{V}$ ; $1\text{ mA} < I_{LOAD} < 30\text{ mA}$	4.85/ <b>4.8</b>	5.0	5.15/ <b>5.2</b>	
Efficiency	$I_{LOAD} = 15\text{ mA}$		85		%
	$I_{LOAD} = 40\text{ mA}$ , $V_{IN} = 3.8\text{V}$		85		
Output Voltage Ripple (Peak-to-Peak)	$I_{LOAD} = 50\text{ mA}$ $C_{OUT} = 10\ \mu\text{F}$ ceramic		75		mV <sub>P-P</sub>

- (1) All limits specified at room temperature (standard typeface) and at temperature extremes (bold typeface). All room temperature limits are 100% tested or specified through statistical analysis. All limits at temperature extremes are specified by correlation using standard Statistical Quality Control methods (SQC). All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical numbers are at 25°C and represent the most likely norm.

## ELECTRICAL CHARACTERISTICS (continued)

Limits in standard typeface are for  $T_A = 25^\circ\text{C}$ , and limits in **boldface** type apply over the full operating temperature range. Unless otherwise specified:  $C_1 = C_2 = 0.33\ \mu\text{F}$ ;  $C_{\text{IN}} = 10\ \mu\text{F}$ ;  $C_{\text{OUT}} = 10\ \mu\text{F}$ ;  $C_{\text{FIL}} = 1\ \mu\text{F}$ ;  $V_{\text{IN}} = 3.5\text{V}$ .

## APPLICATIONS INFORMATION

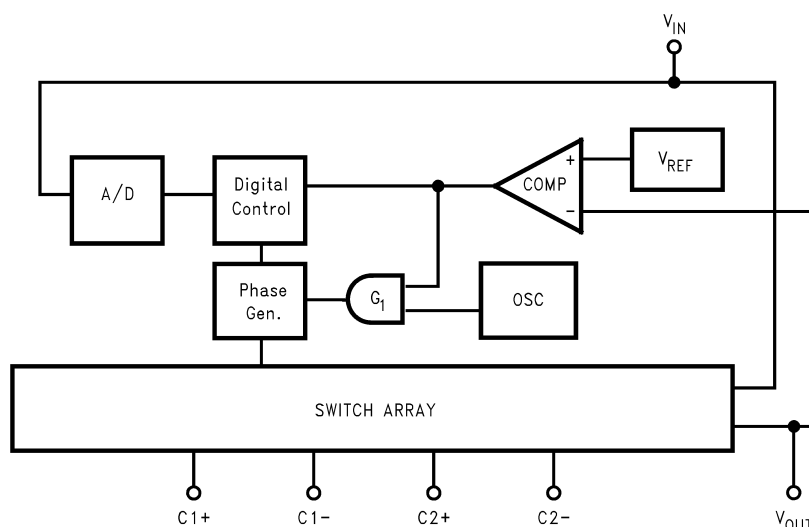

Figure 19. Block Diagram

### Operating Principle

The LM3354 is designed to provide a step-up/step-down voltage regulation in battery powered systems. It combines switched capacitor circuitry, reference, comparator, and shutdown logic in a single 10-pin VSSOP package. The LM3354 can provide a regulated voltage between 1.8V and 5.0V from an input voltage between 2.5V and 5.5V. It can supply a load current up to 90 mA (refer to [Electrical Characteristics](#)).

As shown in [Figure 19](#), the LM3354 employs two feedback loops to provide regulation in the most efficient manner possible. The first loop is from  $V_{OUT}$  through the comparator COMP, the AND gate  $G_1$ , the phase generator, and the switch array. The comparator's output is high when  $V_{OUT}$  is less than the reference  $V_{REF}$ . Regulation is provided by gating the clock to the switch array. In this manner, charge is transferred to the output only when needed. The second loop controls the gain configuration of the switch array. This loop consists of the comparator, the digital control block, the phase generator, and the switch array. The digital control block computes the most efficient gain from a set of five gains based on inputs from the A/D and the comparator. The gain signal is sent to the phase generator which then sends the appropriate timing and configuration signals to the switch array. This dual loop provides regulation over a wide range of loads efficiently.

Since efficiency is automatically optimized, the curves for  $V_{OUT}$  vs.  $V_{IN}$  and Efficiency vs.  $V_{IN}$  in the [Typical Performance Characteristics](#) section exhibit small variations. The reason is that as input voltage or output load changes, the digital control loops are making decisions on how to optimize efficiency. As the switch array is reconfigured, small variations in output voltage and efficiency result. In all cases where these small variations are observed, the part is operating correctly; minimizing output voltage changes and optimizing efficiency.

### Charge Pump Capacitor Selection

A 0.33  $\mu$ F ceramic capacitor is suggested for C1 and C2. To ensure proper operation over temperature variations, an X7R dielectric material is recommended.

### Filter Capacitor Selection

#### CAPACITOR TECHNOLOGIES

The three major technologies of capacitors that can be used as filter capacitors for LM3354 are:

1. tantalum
2. ceramic
3. polymer electrolytic technologies

### Tantalum

Tantalum capacitors are widely used in switching regulators. Tantalum capacitors have the highest CV rating of any technology; as a result, high values of capacitance can be obtained in relatively small package sizes. It is also possible to obtain high value tantalum capacitors in very low profile (<1.2 mm) packages. This makes the tantalums attractive for low-profile, small size applications. Tantalums also possess very good temperature stability; i.e., the change in the capacitance value, and impedance over temperature is relatively small. However, the tantalum capacitors have relatively high ESR values which can lead to higher voltage ripple and their frequency stability (variation over frequency) is not very good, especially at high frequencies (>1 MHz).

### Ceramic

Ceramic capacitors have the lowest ESR of the three technologies and their frequency stability is exceptionally good. These characteristics make the ceramics an attractive choice for low ripple, high frequency applications. However, the temperature stability of the ceramics is bad, except for the X7R and X5R dielectric types. High capacitance values (>1  $\mu\text{F}$ ) are achievable from companies such as Taiyo-yuden which are suitable for use with regulators. Ceramics are taller and larger than the tantalums of the same capacitance value.

### Polymer Electrolytic

Polymer electrolytic is a third suitable technology. Polymer capacitors provide some of the best features of both the ceramic and the tantalum technologies. They provide very low ESR values while still achieving high capacitance values. However, their ESR is still higher than the ceramics, and their capacitance value is lower than the tantalums of the same size. Polymers offer good frequency stability (comparable to ceramics) and good temperature stability (comparable to tantalums). The Aluminum Polymer Electrolytics offered by Cornell-Dubilier and Panasonic, and the POSCAPs offered by Sanyo fall under this category.

Table 1 compares the features of the three capacitor technologies.

**Table 1. Comparison of Capacitor Technologies**

	Ceramic	Tantalum	Polymer Electrolytic
<b>ESR</b>	Lowest	High	Low
<b>Relative Height</b>	Low for Small Values (<10 $\mu\text{F}$ ); Taller for Higher Values	Lowest	Low
<b>Relative Footprint</b>	Large	Small	Largest
<b>Temperature Stability</b>	X7R/X5R-Acceptable	Good	Good
<b>Frequency Stability</b>	Good	Acceptable	Good
<b>V<sub>OUT</sub> Ripple Magnitude @ &lt;50 mA</b>	Low	High	Low
<b>V<sub>OUT</sub> Ripple Magnitude @ &gt;100 mA</b>	Low	Slightly Higher	Low
<b>dv/dt of V<sub>OUT</sub> Ripple @ All Loads</b>	Lowest	High	Low

## CAPACITOR SELECTION

### Output Capacitor (C<sub>OUT</sub>)

The output capacitor C<sub>OUT</sub> directly affects the magnitude of the output ripple voltage so C<sub>OUT</sub> should be carefully selected. The graphs titled V<sub>OUT</sub> Ripple vs. C<sub>OUT</sub> in the [Typical Performance Characteristics](#) section show how the ripple voltage magnitude is affected by the C<sub>OUT</sub> value and the capacitor technology. These graphs are taken at the gain at which worst case ripple is observed. In general, the higher the value of C<sub>OUT</sub>, the lower the output ripple magnitude. At lighter loads, the low ESR ceramics offer a much lower V<sub>OUT</sub> ripple than the higher ESR tantalums of the same value. At higher loads, the ceramics offer a slightly lower V<sub>OUT</sub> ripple magnitude than the tantalums of the same value. However, the dv/dt of the V<sub>OUT</sub> ripple with the ceramics and polymer electrolytics is much lower than the tantalums under all load conditions. The tantalums are suggested for very low profile, small size applications. The ceramics and polymer electrolytics are a good choice for low ripple, low noise applications where size is less of a concern.

### Input Capacitor ( $C_{IN}$ )

The input capacitor  $C_{IN}$  directly affects the magnitude of the input ripple voltage, and to a lesser degree the  $V_{OUT}$  ripple. A higher value  $C_{IN}$  will give a lower  $V_{IN}$  ripple. To optimize low input and output ripple as well as size a 10  $\mu$ F polymer electrolytic or ceramic, or 15  $\mu$ F tantalum capacitor is recommended. This will ensure low input ripple at 90 mA load current. If lower currents will be used or higher input ripple can be tolerated then a smaller capacitor may be used to reduce the overall size of the circuit. The lower ESR ceramics and polymer electrolytics achieve a lower  $V_{IN}$  ripple than the higher ESR tantalums of the same value. Tantalums make a good choice for small size, very low profile applications. The ceramics and polymer electrolytics are a good choice for low ripple, low noise applications where size is less of a concern. The 10  $\mu$ F polymer electrolytics are physically much larger than the 15  $\mu$ F tantalums and 10  $\mu$ F ceramics.

### $C_{FIL}$

A 1  $\mu$ F, X7R ceramic capacitor should be connected to pin  $C_{FIL}$ . This capacitor provides the filtering needed for the internal supply rail of the LM3354.

Of the different capacitor technologies, a sample of vendors that have been verified as suitable for use with the LM3354 are shown in [Table 2](#).

**Table 2. Capacitor Vendor Information**

### Maximum Load Under Start-Up

Due to the LM3354's unique start-up sequence, it is not able to start up under all load conditions. Starting with 60 mA or less will allow the part to start correctly under any temperature or input voltage conditions. After the output is in regulation, any load up to the maximum as specified in the Electrical Characteristics may be applied. Using a Power On Reset circuit, such as the LP3470, is recommended if greater start up loads are expected. Under certain conditions the LM3354 can start up with greater load currents without the use of a Power On Reset Circuit.

### Thermal Protection

During output short circuit conditions, the LM3354 will draw high currents causing a rise in the junction temperature. On-chip thermal protection circuitry disables the charge pump action once the junction temperature exceeds the thermal trip point, and re-enables the charge pump when the junction temperature falls back to a safe operating point.

## Typical Application Circuits

Figure 20. Basic Buck/Boost Regulator

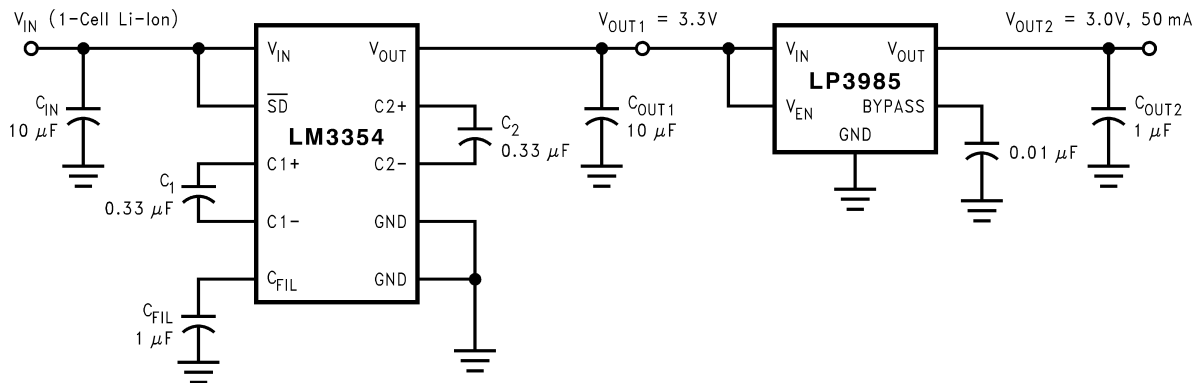

Figure 21. Low Output Noise and Ripple Buck/Boost Regulator

Figure 22. White LED Driver

## Driving Light Emitting Diodes

The LM3354 can be used to drive LED's of nearly any color. The 4.1V option is ideal for driving the White LED's required for the backlight of small color displays. [Figure 22](#) shows the circuit used to power White LED's. The LED current is set by the resistors  $R_B$  by using the equation

$$I_{LED} = (4.1V - V_F)/R_B$$

where

- $V_F$  is the typical forward voltage drop of the LED used

The brightness of the diodes may be controlled using the shutdown pin. A PWM signal on the shutdown pin may be used to adjust the brightness by varying the duty cycle. A signal between 60Hz and 200Hz may be used for best linearity. In this case the equivalent LED current is approximately equal to the maximum current multiplied by the duty cycle. Using frequencies above 200Hz may cause less linear results as the charge and discharge time of the output capacitor becomes more significant.

## Layout Considerations

Due to the 1 MHz typical switching frequency of the LM3354, careful board layout is a must. It is important to place the capacitors as close to the IC as possible and to keep the traces between the capacitors and the IC short and direct. Use of a ground plane is recommended. [Figure 23](#) shows a typical layout as used in the LM3354 evaluation board.

Figure 23. Typical Layout, Top View (magnification 1.5X)

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
