DESCRIPTION
The S54157/N74157 and S54158/N74158 are identical with the exception of the S54158/N74158 being inverted. These devices are logical implementations of a four-pole two-position switch, with the position of the switch being set by the logic levels supplied to the one select input. Both assertion and negation outputs are provided. The enable input ( $E$ ) is active low. When it is not activated the negation output is high and the assertion output is low regardless of all other inputs. The devices provide the ability, in one package, to select four bits of either data or control from two sources. By proper manipulation of the inputs, it can generate four functions of two variables with one variable common. Thus any number of random topic elements used to generate unusual truth tables can be replaced. All outputs are low when disabled (enable high). Both inputs and outputs are buffered.

## PIN CONFIGURATION

S54/N74158
TRUTH TABLE

| INPUTS |  |  | OUTPUT |
| :---: | :---: | :---: | :---: |
| STROBE | SELECT | A B | V |
| H | X | X X | H |
| L | L | L X | H |
| L | L | H X | L |
| L | H | X L | H |
| L | H | X H | L |

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable device type.
- All typical values are at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.
$\dagger$ Not more than one output should be shorted at a time.
