DIGITAL 54/74 TTL SERIES

The S54S151, S54S251, N74S151, and N74S251 Schottkyclamped, high-performance, eight-input data selectors/multiplexers are designed for use in veryhigh-speed data routing applications. These multiplexers select one of eight data sources when so directed by the binary address inputs. Both true and complementary data are presented when the strobe inpiut goes low.

The S54S151 and N74S151 are functionally and mechanically interchangeable with the S54:151 and N74151 respectively, and in most TTL systems can be utilized to upgrade the performance of existing designs as delay times are typically half that of the S54151 or N74151.

The S54S251 and N74S251 have three-state outputs which permit the outputs to be connected to a common bus. When the strobe input is high, both outputs are in a high-impedance state in which both the upper and lower tranjistors of each totem-pole output are off, and the output can neither drive nor load the bus. When the strobe is low, the outputs are dictivated and operate as standard TTL totem-pole outputs.

Typical power dissipation is $\mathbf{2 2 5}$ milliwatts for the S54S151 or N74S151 and 275 milliwatts for the S54S251 and N74S251, or approximately 14 and 17 milliwatts respectively per equivalent gate. The S54S151 and S54S251 are characterized for operation over the full mititary temperature range of $-55^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$; the N74S151 and N 74 S 251 are characterized for operation from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$.

## PIN CONFIGURATION

## FEATURES

- S54S151/N74S151 INTERCHANGEABLE WITH S54151/N74151 IN MOST SYSTEMS
- SCHOTTKY CLAMPED FOR SIGNIFICANT REDUCTION IN DELAY TIMES... 4.5 ns TYPICAL, DATA INPUT TO W OUTPUT
- HIGH-SPEED SELECTION FOR ONE OF EIGHT DATA SOURCES
- PERMITS MULTIPLEXING FROM N LINES TO ONE LINE
- S54S251 AND N74S251 HAVE TRI-STATE OUTPUTS
- FULLY COMPATIBLE WITH SERIES 54/74 AND OTHER TTL MSI CIRCUITS
