## VIDEO SUPER IMPOSER WITH AFC

## - GENERAL DESCRIPTION

The NJM2217 has functions of character and background superimposition to video signal and consists of synchronous separation circuit, vertical synchronous reproducing circuit, video switch and AFC circuit. Built-in AFC circuit makes the NJM2217 stable to noise and disorder of synchronous signal and takes off character disorder on Display Broun tube.

- PACKAGE OUTLINE

NJM2217L

## - FEATURES

$$
(+4 \mathrm{~V} \sim+6 \mathrm{~V})
$$

- Operating Volage
- 2 video signal input terminals
- Internal synchronous separation Circuit and internal horizontal synchronous reproduce circuit. Can make trigger signal to character generator.
- Stable horizontal synchronous signal by build-in AFC circuit.
- Package Outline

SDIP22, DMP24

- Bipolar Technology

- RECOMMENDED OPERATING CONDITION

NJM2217M

- Operating Voluge
$4 \mathrm{~V} \sim 6 \mathrm{~V}$

## - APPLICATION

- VCR, Video Camera, Other Video Equipment

## ■ BLOCK DIAGRAM.

## - ELECTRICAL CHARACTERISTICS

(Note 1): AFC input is composite synchronous signal.
(Note 2): Time lag between horizontal synchronous signal with AFC and without AFC. (The timing gap at 9 pin output, in the case of 8 pin $=$ high, and 8 pin $=$ low.)

- TEST CIRCUIT

## - AFC CIRCUIT CONFIGURATION \& ITS FEATURE

The NJM2217 has AFC function of horizontal synchronous signal applied to character generator. AFC circuit of the NJM2217 is like PLL circuit and operates as band pass filter. If pulse Noise is mixed to the input horizontal synchronous signal of AFC circuit, it does not appear at AFC output when AFC circuit is on the lock condition. Because if noise appeared at output of phase comparator, low pass filter takes off it and it is not carried to VCO circuit. (Fig.I).

Fig. 2 shows block diagram of AFC circuit.

Fig. 1 Input and Output of AFC circuit with Mixed Noise

## - PRINCIPLES OF OPERATION

1) Video Switch

The NJM2217 has three video switches. One of them is used to select one video signal from two input video signal, and two others are used for super-imposer of character and background. Switching operation is done by putting DC voltage in to Pin 16,18 or 20 , and its threshold voltage is 1.4 V typical.

The NJM2217 has inside clamp circuit, and input video signal of Pin3 or Pin21 is sink-chip-clamped at 2.1 V . Output circuit is emitter follower and drives to $5 \mathrm{k} \Omega$ load.
2) Synchronous Separation Circuit

It separates composit synchronous signal from video signal, and this composit synchronous signal is applied to AFC circuit. And finally you can get horizontal synchronous signal ( $\mathrm{H}_{\text {sync }}$ ) from AFC circuit. Operation of synchronous separation is possible if signal level from synchronous signal top is more than $120 \mathrm{~m} \mathrm{~V}_{\mathrm{p} \cdot \mathrm{p}}$.
3) Vertical Synchronous Reproduce Circuit

Composit signal from synchronous separation circuit is applied to integrator and triangle wave from it goes to schmitt trigger circuit which reproduces vertical synchronous signal. Output circuit is emitter follower and output voltage is $4 \mathrm{~V}_{\mathrm{P}-\mathrm{p}}$ at $2 \mathrm{k} \Omega$ load.
4) AFC Circuit

Fig. 3 shows block diagram of AFC circuit. Voltage proportional to phase difference between horizontal synchronous signal putted in to phase comparator and triangular wave from VCO is smoothed by low pass filter and is put in to VCO. This VCO frequency is changed to direction of coincidence with input frequency. Triangular wave from VCO olatput flows through window comparator and $5 \mu \mathrm{~s}$ width of output pulse signal which is same width to $\mathrm{H}_{\text {sync }}$ appears.

Fig. 3 AFC Circuit Block
a) Free-Run Frequency

Free-run frequency depends on resistor R 3 between $\operatorname{Pin} 5$ and ground, and capacitor $\mathrm{C}_{\mathrm{AFC}}$ between Pin6 and ground.

$$
\mathrm{I}_{\text {FREE }}=1 /\left(3.3 \cdot \mathrm{C}_{\mathrm{AFC}} \cdot \mathrm{R} 3\right)[\mathrm{Hz}](1)
$$

b) Parameter ol Low Pass Filter

Impedance vs. frequency chatacteristic from Pin 4 to Pin 5 is shown on Fig. 4.

Fig. 4 Low Pass Filter Impedance Characteristics
$\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{Z}_{1}, \mathrm{Za}, \mathrm{Zb}$ are shown below.

| $P_{1}=1 /\left\{2 \pi C_{2}\left(R_{2}+R_{3}\right)\right\}$ | $\|H z\|$ | $(2)$ |
| :--- | :--- | :--- |
| $P_{2}=1 /\left(2 \pi C_{1} \cdot R_{1}\right)$ | $\|H z\|$ | $(3)$ |
| $Z_{1}=1 /\left(2 \pi C_{2} \cdot R_{1}\right)$ | $\|H \%\|$ | $(4)$ |
| $Z a=R_{2}+R_{3}$. |  | $(5)$ |
| $Z b=R_{1}$ |  | $(6)$ |

Za is decided by $R_{2}$ and $R_{3}$ is decided by free run frequency and so $Z a$ is generally decided by $R_{2}$. Value of $\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{Z}_{1}, \mathrm{Za}, \mathrm{Zb}$ affects lock range, capture range, frequency fluctuations of AFC output and others. It is preferable that $\mathrm{P}_{2}$ is 15 kHz and $\mathrm{Z}_{1}$ is 60 Hz . When Zb becomes large, lock and capture range becomes wide but fluctuations of AFC output frequency will increase. Large Za decreases fluctuations.

## . DESIGN EXAMPLE OF L.P. FILTER

$$
\begin{aligned}
& \mathrm{P}_{1}=2 \mathrm{~Hz} \\
& \mathrm{P}_{2}=16 \mathrm{kHz} \\
& \mathrm{Z}_{1}=60 \mathrm{~Hz} \\
& \mathrm{Za}=40 \mathrm{k} \Omega \\
& \mathrm{Zb}=1 \mathrm{k} \Omega \\
& \mathrm{C}_{\text {AFC }}=680 \mathrm{pF}
\end{aligned}
$$

Each value of low pass filter is caluculated below. If decided free run frequency to 15.74 kHz , and from equation (1).

$$
\mathrm{R}_{3}=28.4 \mathrm{k} \Omega
$$

$Z a=40 \mathrm{k} \Omega$ and equation (5),

$$
\mathrm{R}_{2}=12 \mathrm{k} \Omega
$$

From equation (2),

$$
\mathrm{C}_{2}=2.1 \mu \mathrm{~F}
$$

From equation (4),

$$
\mathrm{R}_{1}=1.3 \mathrm{k} \Omega
$$

From equation (3)

$$
\mathrm{C}_{1}=7700 \mathrm{pF}
$$

Measured value at $\mathrm{R}_{1}=1 \mathrm{k} \Omega, \mathrm{R}_{2}=10 \mathrm{k} \Omega, \mathrm{C}_{1}=1 \mu \mathrm{~F}, \mathrm{C}_{2}=2.2 \mu \mathrm{~F}$.
Lock range $=3.3 \mathrm{kHz}$
Capture range $=1.7 \mathrm{kHz}$
(Note) Temperature characteristics of free run frequency, lock and capture range are deeply affected by temperature coefficient of $\mathrm{C}_{\text {Af }}$ and each device of low pass filter, and so it is preferable using low temperature coefficient device. If temperature coefficient of $C_{A F C}$ and $R_{3}$ is $0 p p m /{ }^{\circ} \mathrm{C}$ temperature coefficient of free run frequency is almost $0 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$. (Ref. to typical characteristics graph.)

## ■APPLICATION

This IC requires $1 \mathrm{M} \Omega$ resistance between INPUT and GND pin for clamp type input since the minute current causes an unstable pin voltage.
