

200pin Unbuffered DDR SO-DIMM Based on DDR266 16Mx16 SDRAM

Features

- JEDEC Standard 200-Pin Small Outline Dual In-Line Memory Module (SO-DIMM)
- 16Mx64 Double Unbuffered DDR SO-DIMM based on 16Mx16 DDR SDRAM.
- Performance:

	PC2100	
Speed Sort	-75B	Unit
DIMM $\overline{\text{CAS}}$ Latency	2.5	
f _{CK} Clock Frequency	133	MHz
t _{CK} Clock Cycle	7.5	ns
f _{DQ} DQ Burst Frequency	266	MHz

- Intended for 133 MHz applications
- Inputs and outputs are SSTL-2 compatible
- V_{DD} = 2.5Volt \pm 0.2, V_{DDQ} = 2.5Volt \pm 0.2
- SDRAMs have 4 internal banks for concurrent operation
- Module has one physical bank
- Differential clock inputs

- Data is read or written on both clock edges
- DRAM DLL aligns DQ and DQS transitions with clock transitions.
- Address and control signals are fully synchronous to positive clock edge
- Programmable Operation:
 - DIMM $\overline{\text{CAS}}$ Latency: 2, 2.5
 - Burst Type: Sequential or Interleave
 - Burst Length: 2, 4, 8
 - Operation: Burst Read and Write
- Auto Refresh (CBR) and Self Refresh Modes
- Automatic and controlled precharge commands
- 13/9/1 Addressing (row/column/bank)
- 7.8 μ s Max. Average Periodic Refresh Interval
- Serial Presence Detect
- Gold contacts
- SDRAMs in 66-pin TSOP Type II Package

Description

NT128D64SH4B0GM is an unbuffered 200-Pin Double Data Rate (DDR) Synchronous DRAM Small Outline Dual In-Line Memory Module (SO-DIMM), organized as a one-bank 16Mx64 high-speed memory array. The module uses four 16Mx16 DDR SDRAMs in 400 mil TSOP II packages. These DIMMs are manufactured using raw cards developed for broad industry use as reference designs. The use of these common design files minimizes electrical variation between suppliers. All NANYA DDR SDRAM DIMMs provide a high-performance, flexible 8-byte interface in a 2.66" long space-saving footprint.

The DIMM is intended for use in applications operating up to 133 MHz clock speeds and achieves high-speed data transfer rates of up to 266 MHz. Prior to any access operation, the device $\overline{\text{CAS}}$ latency and burst type/ length/operation type must be programmed into the DIMM by address inputs A0-A12 and I/O inputs BA0 and BA1 using the mode register set cycle.

The DIMM uses serial presence-detect implemented via a serial 2,048-bit EEPROM using a standard IIC protocol. The first 128 bytes of serial PD data are programmed and locked during module assembly. The remaining 128 bytes are available for use by the customer.

Ordering Information

Note: All pin assignments are consistent for all 8-byte unbuffered versions.

Input/Output Functional Description

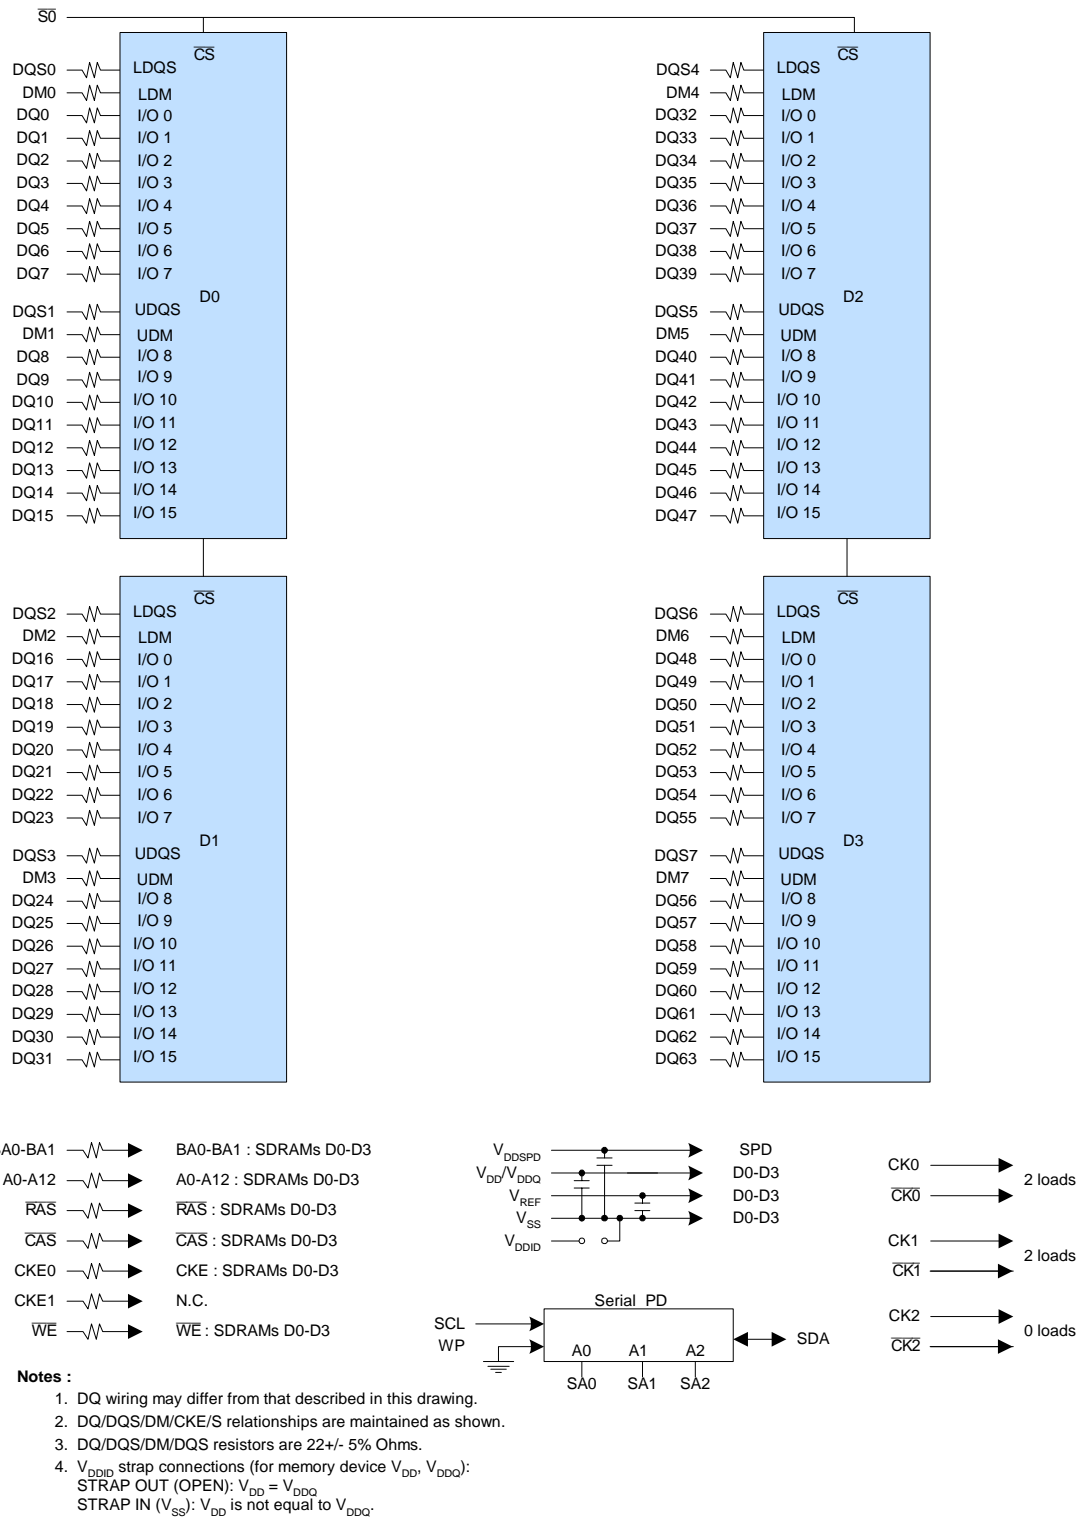

Symbol	Type	Polarity	Function
CK0, CK1, CK2, $\overline{\text{CK0}}, \overline{\text{CK1}}, \overline{\text{CK2}}$	(SSTL)	Cross point	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of CK. A Delay Locked Loop (DLL) circuit is driven from the clock inputs and output timing for read operations is synchronized to the input clock.
CKE0	(SSTL)	Active High	Activates the DDR SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
$\overline{\text{S0}}$	(SSTL)	Active Low	Enables the associated DDR SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Physical Bank 0 is selected by S0; Bank 1 is selected by S1.
$\overline{\text{RAS}}, \overline{\text{CAS}}, \overline{\text{WE}}$	(SSTL)	Active Low	When sampled at the positive rising edge of the clock, $\overline{\text{RAS}}, \overline{\text{CAS}}, \overline{\text{WE}}$ define the operation to be executed by the SDRAM.
VREF	Supply		Reference voltage for SSTL-2 inputs
VDDQ	Supply		Isolated power supply for the DDR SDRAM output buffers to provide improved noise immunity
BA0, BA1	(SSTL)	-	Selects which SDRAM bank is to be active.
A0 - A9 A10/AP A11, A12	(SSTL)	-	During a Bank Activate command cycle, A0-A12 defines the row address (RA0-RA12) when sampled at the rising clock edge. During a Read or Write command cycle, A0-A9 defines the column address (CA0-CA9) when sampled at the rising clock edge. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the Burst Read or Write cycle. If AP is high, autoprecharge is selected and BA0/BA1 define the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0/BA1 to control which bank(s) to precharge. If AP is high all 4 banks will be precharged regardless of the state of BA0/BA1. If AP is low, then BA0/BA1 are used to define which bank to pre-charge.
DQ0 - DQ63	(SSTL)	-	Data and Check Bit input/output pins operate in the same manner as on conventional DRAMs.
DQS0 - DQS7	(SSTL)	Active High	Data strobes: Output with read data, input with write data. Edge aligned with read data, centered on write data. Used to capture write data.
DM0 – DM7	Input	Active High	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect. DM8 is associated with check bits CB0-CB7, and is not used on x64 modules.
VDD, VSS	Supply		Power and ground for the DDR SDRAM input buffers and core logic
SA0 – SA2		-	Address inputs. Connected to either VDD or VSS on the system board to configure the Serial Presence Detect EEPROM address.
SDA		-	This bi-directional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to VDD to act as a pullup.
SCL		-	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to VDD to act as a pullup.
VDDSPD	Supply		Serial EEPROM positive power supply.

Absolute Maximum Ratings

Symbol	Parameter	Rating	Units
V_{IN}, V_{OUT}	Voltage on I/O pins relative to Vss	-0.5 to VDDQ+0.5	V
V_{IN}	Voltage on Input relative to Vss	-0.5 to +3.6	V
V_{DD}	Voltage on VDD supply relative to Vss	-0.5 to +3.6	V
V_{DDQ}	Voltage on VDDQ supply relative to Vss	-0.5 to +3.6	V
T_A	Operating Temperature (Ambient)	0 to +70	°C
T_{STG}	Storage Temperature (Plastic)	-55 to +150	°C
P_D	Power Dissipation	4	W
I_{OUT}	Short Circuit Output Current	50	mA

Note: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Capacitance

Parameter	Symbol	Max.	Units	Notes
Input Capacitance: CK0, $\overline{CK0}$, CK1, $\overline{CK1}$, CK2, $\overline{CK2}$	CI1	12	pF	1
Input Capacitance: A0-A11, BA0, BA1, \overline{WE} , \overline{RAS} , \overline{CAS} , CKE0, $\overline{S0}$	CI2	30	pF	1
Input Capacitance: SA0-SA2, SCL	CI4	9	pF	1
Input/Output Capacitance DQ0-63; DQS0-7	CI01	7	pF	1, 2
Input/Output Capacitance: SDA	CI03	11	pF	

1. VDDQ = VDD = 2.5V \pm 0.2V, f = 100 MHz, T_A = 25 °C, VOUT (DC) = VDDQ/2, VOUT (Peak to Peak) = 0.2V.

2. DQS inputs are grouped with I/O pins reflecting the fact that they are matched in loading to DQ and DQS to facilitate trace matching at the board level.

PC2100 Unbuffered DDR SO-DIMM

DC Electrical Characteristics and Operating Conditions

(TA = 0 °C ~ 70 °C; V_{DDQ} = 2.5V ± 0.2V; V_{DD} = 2.5V ± 0.2V, See AC Characteristics)

Symbol	Parameter	Min	Max	Units	Notes
V _{DD}	Supply Voltage	2.3	2.7	V	1
V _{DDQ}	I/O Supply Voltage	2.3	2.7	V	1
V _{SS} , V _{SSQ}	Supply Voltage, I/O Supply Voltage	0	0	V	
V _{REF}	I/O Reference Voltage	0.49 x V _{DDQ}	0.51 x V _{DDQ}	V	1, 2
V _{TT}	I/O Termination Voltage (System)	V _{REF} - 0.04	V _{REF} + 0.04	V	1, 3
V _{IH} (DC)	Input High (Logic1) Voltage	V _{REF} + 0.15	V _{DDQ} + 0.3	V	1
V _{IL} (DC)	Input Low (Logic0) Voltage	-0.3	V _{REF} - 0.15	V	1
V _{IN} (DC)	Input Voltage Level, CK and \overline{CK} Inputs	-0.3	V _{DDQ} + 0.3	V	1
V _{ID} (DC)	Input Differential Voltage, CK and \overline{CK} Inputs	0.30	V _{DDQ} + 0.6	V	1, 4
I _I	Input Leakage Current Any input 0V ≤ V _{IN} ≤ V _{DD} ; (All other pins not under test = 0V)	-5	5	uA	1
I _{OZ}	Output Leakage Current (DQs are disabled; 0V ≤ V _{out} ≤ V _{DDQ})	-5	5	uA	1
I _{OH}	Output High Current (V _{OUT} = V _{DDQ} - 0.373V, min V _{REF} , min V _{TT})	-16.8	-	mA	1
I _{OL}	Output Low Current (V _{OUT} = 0.373, max V _{REF} , max V _{TT})	16.8	-	mA	1

1. Inputs are not recognized as valid until V_{REF} stabilizes.
2. V_{REF} is expected to be equal to 0.5 V_{DDQ} of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on V_{REF} may not exceed 2% of the DC value.
3. V_{TT} is not applied directly to the DIMM. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF}, and must track variations in the DC level of V_{REF}.
4. V_{ID} is the magnitude of the difference between the input level on CK and the input level on \overline{CK} .

AC Characteristics

(Notes 1-5 apply to the following Tables; Electrical Characteristics and DC Operating Conditions, AC Operating Conditions, Operating, Standby, and Refresh Currents, and Electrical Characteristics and AC Timing.)

1. All voltages referenced to VSS.
2. Tests for AC timing, I_{DD}, and electrical, AC and DC characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. Outputs measured with equivalent load. Refer to the AC Output Load Circuit below.
4. AC timing and I_{DD} tests may use a V_{IL} to V_{IH} swing of up to 1.5V in the test environment, but input timing is still referenced to V_{REF} (or to the crossing point for CK, $\overline{\text{CK}}$), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals is 1V/ns in the range between V_{IL} (AC) and V_{IH} (AC) unless otherwise specified.
5. The AC and DC input level specifications are as defined in the SSTL_2 Standard (i.e. the receiver effectively switches as a result of the signal crossing the AC input level, and remains in that state as long as the signal does not ring back above (below) the DC input LOW (HIGH) level.

AC Output Load Circuits

AC Operating Conditions

(T_A = 0 °C ~ 70 °C; V_{DDQ} = 2.5V ± 0.2V; V_{DD} = 2.5V ± 0.2V, See AC Characteristics)

Symbol	Parameter/Condition	Min	Max	Unit	Notes
V _{IH} (AC)	Input High (Logic 1) Voltage.	V _{REF} + 0.31		V	1, 2
V _{IL} (AC)	Input Low (Logic 0) Voltage.		V _{REF} - 0.31	V	1, 2
V _{ID} (AC)	Input Differential Voltage, CK and $\overline{\text{CK}}$ Inputs	0.62	V _{DDQ} + 0.6	V	1, 2, 3
V _{IX} (AC)	Input Differential Pair Cross Point Voltage, CK and $\overline{\text{CK}}$ Inputs	(0.5*V _{DDQ}) - 0.2	(0.5*V _{DDQ}) + 0.2	V	1, 2, 4

1. Input slew rate = 1V/ ns.
2. Inputs are not recognized as valid until V_{REF} stabilizes.
3. V_{ID} is the magnitude of the difference between the input level on CK and the input level on $\overline{\text{CK}}$.
4. The value of V_{IX} is expected to equal 0.5*V_{DDQ} of the transmitting device and must track variations in the DC level of the same.

t _{WPRES}	Write preamble setup time		0		ns	1-4, 7
t _{WPST}	Write postamble		0.40	0.60	tCK	1-4, 6
t _{WPRE}	Write preamble		0.25		tCK	1-4
t _{IH}	Address and control input hold time (fast slew rate)		0.9		ns	2-4, 9, 11, 12
t _{IS}	Address and control input setup time (fast slew rate)		0.9		ns	2-4, 9, 11, 12
t _{IH}	Address and control input hold time (slow slew rate)		1.0		ns	2-4, 10, 11, 12, 14

AC Timing Specifications for DDR SDRAM Devices Used on Module

(TA = 0 °C ~ 70 °C; V_{DDQ} = 2.5V ± 0.2V; V_{DD} = 2.5V ± 0.2V, See AC Characteristics) (Part 2 of 2)

Symbol	Parameter	-75B		Unit	Notes
		Min.	Max.		
tIS	Address and control input setup time (slow slewrate)	1.0		ns	2-4, 10-12, 14
tIPW	Input pulse width	2.2		ns	2-4, 12
tRPRE	Read preamble	0.9	1.1	tCK	1-4
tRPST	Read postamble	0.40	0.60	tCK	1-4
tRAS	Active to Precharge command	45	120,000	ns	1-4
tRC	Active to Active/Auto-refresh command period	65		ns	1-4
tRFC	Auto-refresh to Active/Auto-refresh command period	75		ns	1-4
tRCD	Active to Read or Write delay	20		ns	1-4
tRAP	Active to Read Command with Autoprecharge	20		ns	1-4
tRP	Precharge command period	20		ns	1-4
tRRD	Active bank A to Active bank B command	15		ns	1-4
tWR	Write recovery time	15		ns	1-4
tDAL	Auto precharge write recovery + precharge time	(tWR/tCK) + (tRP/tCK)		tCK	1-4, 13
tWTR	Internal write to read command delay	1		tCK	1-4
tPDEX	Power down exit time	7.5		ns	1-4
tXSNR	Exit self-refresh to non-read command	75		ns	1-4
tXSRD	Exit self-refresh to read command	200		tCK	1-4
tREFI	Average Periodic Refresh Interval		7.8	μs	1-4, 8

AC Timing Specification Notes

- Input slew rate = 1V/ns.
- The CK/ $\overline{\text{CK}}$ input reference level (for timing reference to CK/ $\overline{\text{CK}}$) is the point at which CK and $\overline{\text{CK}}$ cross: the input reference level for signals other than CK/ $\overline{\text{CK}}$ is VREF.
- Inputs are not recognized as valid until VREF stabilizes.
- The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (Note 3) is VTT.
- tHZ and tLZ transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
- The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- The specific requirement is that DQS be valid (high, low, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from high to low at this time, depending on tDQSS.
- A maximum of eight Auto refresh commands can be posted to any given DDR SDRAM device.
- For command/address input slew rate ≥ 1.0 V/ns. Slew rate is measured between VOH (AC) and VOL (AC).
- For command/address input slew rate ≥ 0.5 V/ns and < 1.0 V/ns. Slew rate is measured between VOH (AC) and VOL (AC).
- CK/ $\overline{\text{CK}}$ slew rates are ≥ 1.0 V/ns.
- These parameters guarantee device timing, but they are not necessarily tested on each device, and they may be guaranteed by design or tester characterization.
- For each of the terms in parentheses, if not already an integer, round to the next highest integer. tCK is equal to the actual system clock cycle time. For example, for PC2100 at CL= 2.5, tDAL = (15ns/7.5ns) + (20ns/7.0ns) = 2 + 3 = 5.
- An input setup and hold time derating table is used to increase tIS and tIH in the case where the input slew rate is below 0.5 V/ns.

Input Slew Rate	Delta (tIS)	Delta (tIH)	Unit	Note
0.5 V/ns	0	0	ps	1, 2
0.4 V/ns	+50	0	ps	1, 2
0.3 V/ns	+100	0	ps	1, 2

- Input slew rate is based on the lesser of the slew rates determined by either V IH (AC) to V IL (AC) or V IH (DC) to V IL (DC), similarly for rising transitions.
- These derating parameters may be guaranteed by design or tester characterization and are not necessarily tested on each device.

- An input setup and hold time derating table is used to increase tDS and tDH in the case where the I/O slew rate is below 0.5 V/ns.

Input Slew Rate	Delta (tDS)	Delta (tDH)	Unit	Note
0.5 V/ns	0	0	ps	1, 2
0.4 V/ns	+75	+75	ps	1, 2
0.3 V/ns	+150	+150	ps	1, 2

- I/O slew rate is based on the lesser of the slew rates determined by either V IH (AC) to V IL (AC) or V IH (DC) to V IL (DC), similarly for rising transitions.
- These derating parameters may be guaranteed by design or tester characterization and are not necessarily tested on each device.

- An I/O Delta Rise, Fall Derating table is used to increase tDS and tDH in the case where DQ, DM, and DQS slew rates differ.

Delta Rise and Fall Rate	Delta (tDS)	Delta (tDH)	Unit	Note
0.0 ns/V	0	0	ps	1-4
0.25 ns/V	+50	+50	ps	1-4
0.5 ns/V	+100	+100	ps	1-4

- Input slew rate is based on the lesser of the slew rates determined by either V IH (AC) to V IL (AC) or V IH (DC) to V IL (DC), similarly for rising transitions.
- Input slew rate is based on the larger of AC to AC delta rise, fall rate and DC to DC delta rise, fall rate.
- The delta rise, fall rate is calculated as: $[1/(\text{slew rate } 1)] - [1/(\text{slew rate } 2)]$
For example: slew rate 1 = 0.5 V/ns; slew rate 2 = 0.4 V/ns. Delta rise, fall = $(1/0.5) - (1/0.4)$ [ns/V] = -0.5 ns/V
Using the table above, this would result in an increase in tDS and tDH of 100 ps.
- These derating parameters may be guaranteed by design or tester characterization and are not necessarily tested on each device.

Revision Log

Rev	Date	Modification
0.1	08/2002	Preliminary Release
0.2	09/2002	Added t_{PDEX} (Power down exit time) to AC Timing Table
		Updated I_{DD} values for PC2100 in Operating, Standby, and Refresh Currents Table
1.0	09/2002	Official Release
1.1	09/2002	Fixed side view of Package Dimensions Diagram
1.2	10/2002	Updated I_{DD7} value to 1380 mA in Operating, Standby, and Refresh Currents Table
1.3	11/2002	Updated I_{DD6} value to 8 mA in Operating, Standby, and Refresh Currents Table
1.4	01/2003	Updated I_{DD6} value to 12 mA in Operating, Standby, and Refresh Currents Table
		Removed DDR333 (-6K) speed grade
1.5	01/2003	Updated Operating, Standby, and Refresh Currents Table
