3. Operation

The following describes the structure and operation of the TMP95CW54A hardware.

This device is created from the TMP95CU54A by expanding its internal ROM size to 128 Kbytes and its internal RAM size to 4 Kbytes. Otherwise, TMP95CW54A is structurally and operationally identical to TMP95CU54A. Accordingly, for functions not described here, see the TMP95CU54A section of the manual.

3.1 MCU Mode

Opening the CLK pin (setting to output) sets MCU mode.

In MCU mode, TMP95CW54A operates the same as TMP95CU54A.

3.2 Memory Map

Figure 3.2.1 shows the memory map in MCU mode and the CPU access area in each addressing mode.

4. Electrical Characteristics (Preliminary)

4.1 Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit
Power Supply Voltage	V_{CC}	- 0.5 to + 6.5	V
Input Voltage	V_{IN}	- 0.5 to $V_{CC} + 0.5$	V
Output current (total)	ΣI_{OL}	+ 120	mA
Output current (total)	ΣI_{OH}	- 120	mA
Power Dissipation ($T_a = + 85^{\circ}\text{C}$)	P_D	600	mW

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

NMI, INT0 to 4 high-level pulse width	t_{INTAH}	$4x$		167		ns

4.8 Bus Request/Bus Acknowledge Timing

 $V_{CC} = +5V \pm 10\%$, $T_a = -40$ to $+85^\circ\text{C}$ ($f_c = 8$ to 24 MHz)

Parameter	Symbol	Variable		24 MHz		Unit
		Min	Max	Min	Max	
BUSRQ setup time for CLK	t_{BRC}	120		120		ns
CLK \rightarrow BUSAK fall	t_{CBAL}		$2.0x + 120$		203	ns
CLK \rightarrow BUSAK rise	t_{CBAH}		$0.5x + 40$		61	ns
Time from output buffer off until BUSAK falling edge	t_{ABA}	0	80	0	80	ns
Time from BUSAK rising edge until output buffer on	t_{BAA}	0	80	0	80	ns

Note 1: When $\overline{\text{BUSRQ}}$ goes to low level to request bus release, if the current bus cycle is yet complete due to a wait, the bus is not released until the wait completes.

Note 2: The dotted line indicates only that the output buffer is off, not that the signal is at middle level. Immediately after bus release, the signal level prior to the bus release is held dynamically by the external load capacitance. Therefore, designs should allow for the fact that when using an external resistor or similar to fix the signal level while the bus is released, after bus release a delay occurs before the signal goes to its fixed level (due to the CR time constant). The internal programmable pull-up resistor continues to function in accordance with the internal signal level.
