- LOW LEAKAGE CURRENT
- ESD PROTECTION UP TO 15kV

DESCRIPTION

Transil diode arrays provide high overvoltage protection by clamping action. Their instantaneous response to transient overvoltages makes them particularly suited to protect voltage sensitive devices such as MOS Technology and low voltage supplied IC's.

The ITA series allies high surge capability against energetic pulses with high voltage performance against ESD.

The separated input/output configuration of the device ensures improved protection against very fast transient overvoltage like ESD by elimination of the spikes induced by parasitic inductances created by external wiring.

- IEC 1000-4-4 : level 4
- IEC 1000-4-5 : level 2

APPLICATION INFORMATION

Types	Maximum differential voltage between two input pins at 25°C

This monolithic Transil Array is based on 10 unidirectional Transils with a common cathode and can be configured to offer up to 9 bidirectional functions. This imposes a maximum differential voltage between 2 input pins (see opposite table).

Typical application : RS232 junction.

APPLICATION NOTICE

Design advantage of ITAxxxB3 used with 4-point structure.

The ITAxxxB3 has been designed with a 4-point structure (separated Input/output) in order to efficiently protect against disturbances with very high di/dt rates, such as ESD.

The purpose of this 4-point structure is to eliminate the overvoltage introduced by the parasitic inductances of the wiring ($L di/dt$).

Efficient protection depends not only on the component itself, but also on the circuit layout. The drawing given in figure shows the layout to be used in order to take advantage of the 4-point structure of the ITAxxxB3.

With this layout, each line to be protected passes through the protection device.

In this way, it realizes an interface between the data line and the circuit to be protected, guaranteeing an isolation between its inputs and outputs.

The 4 - point structure layout.
